Tamworth Power Station is a 22.5 MW waste wood power facility meeting the electricity needs of approximately 15,000 households and is one of the largest taxpayers in the community. The facility uses wood from trees unsuitable for lumber or pulp, residue and trim ends from local sawmills and tops and limbs of trees. This fuel generates little ash and burns relatively low temperatures. An electrostatic precipitator keeps emissions well below state standards.

QUICK FACTS:

In-Service Date	12/01/87
Percent Ownership	100%
Fuel-Primary	Waste Wood
Resource Type	Base Load
Electric MW	22.5 MW (net)
Electric Customer	Public Service of New Hampshire
